leading academic and industrial researchers working with adaptive systems and signal processing have been given the opportunity to exchange ideas concepts and solutions at the ifac symposia on adaptive systems in control and signal processing this postprint volume contains all those papers which were presented at the 5th ifac symposium in budapest in 1995 the technical program was composed of a number of invited and contributed sessions and a special case study session providing a good balance between applications and theory oriented papers

the field of intelligent control has recently emerged as a response to the challenge of controlling highly complex and uncertain nonlinear systems it attempts to endow the controller with the key properties of adaptation learning and autonomy the field is still immature and there exists a wide scope for the development of new methods that enhance the key properties of intelligent systems and improve the performance in the face of increasingly complex or uncertain conditions the work reported in this book represents a step in this direction a number of original neural network based adaptive control designs are introduced for dealing with plants characterized by unknown functions nonlinearity multimodal behaviour randomness and disturbances the proposed schemes achieve high levels of performance by enhancing the controller's capability for adaptation stabilization management of uncertainty and learning both deterministic and stochastic plants are considered in the deterministic case implementation stability and convergence issues are addressed from the perspective of lyapunov theory when compared with other schemes the methods presented lead to more efficient use of computational storage and

improved adaptation for continuous time systems and more global stability results with less prior knowledge in discrete time systems
